

## **Test Task for a position Strong Junior/Middle Markup Developer (HTML coder)**

### **Task:**

Use an open API for receiving information about airports ([api](#)), and create an application in which the user can receive a list of available routes at the airport.

### **Requirements:**

1. The user opens the page and sees the input for searching for airports.
2. The user enters the name of the airport in the input field (minimum 3 characters).
3. The user receives a list of all available airports that match the name (you can limit yourself to displaying 10 available airports).
4. Each airport in the list looks like a card with the name of the airport, its location and ICAO.

You can choose the design of cards, tables, elements, etc. by yourself.

### **Technologies:**

HTML5, CSS3 (any preprocessor is possible).

Javascript, Ajax.

### **Result:**

A link to the repository is required.

Host the application (possible via github pages).
